

Values/data types: String – characters in quotes Ex: “Hello, World!” Float – #’s w/ decimal point Ex: 4.3 Int – integer, whole number Ex: 7 To get data type – print type
Operators and operands: * = multiplication ** = exponentiation / = division operator, produces floating point if either of operands are float, if both are int, performs integer division & truncates result down to next smallest integer Ex: 9/5 = 1 vs. 9.0/5 = 1.8 // = integer division Ex: 7.0//3.0 = 2.0 % = modulus operator, gives remainder of division problem Ex: 7%3 = 1
Slice String: Substring of string Ex: x = “hey, hi, hello”, print x[0:3] → returns hey
Function calls: Def square(x) Return x*x – squares # Sub(x, y) – x minus y
Statements/expressions: Len – returns # of characters in string Ex: len(s)
Input: Raw_input – opens up prompt window
Boolean: True/false Ex: 5 == 5 is True, 5==6 is False And – true if both = true Or – true if either conditions are true Not – negates Boolean expression
Indexing: Selects character from string Ex: x = “hello” m = x[3] → returns position 3, letter L First position 0 Last position -1 or number in sequence
In/Not in: In – tests if 1 string is substring of another, returns true/false Not in – tests if not in a string, returns true/false
Lists: Elements in [] Len(list) returns # of items in list Len(list[x]) returns # of characters of an element of list
Concatenation/Repetition: Adds lists together Can do list * x → prints list x times
List slices: Same as slice operator for lists Ex: list[x:y] → returns list from x to y
Entropy: how unpredictable an event outcome is- reaches max. when we don’t know what outcome is
Surprisal: property of event outcome that is unlikely to have occurred
Adding to dictionary: Mydict[“new thing”] = x X would be value
Deleting in dictionary: Del mydict[‘key’]

List deletion: Ex: del list[x:y] → deletes items from x to y in list
List methods: .append – adds items, end of list .insert – inserts items to list .reserve x – reverses items in list .sort – sorts items in list .remove – removes items
Split: Breaks string into list of words Ex: x=“Hey how are you” x.split() = [‘Hey’, ‘how’, ‘are’, ‘you’] Takes out what you’re splitting at
Iteration: For loop – iterates over each element of statement Ex: for x in “Hello”: Print x → prints each element on separate lines Ex: fruit [‘apples’, ‘bananas’] For x in fruit: Print x → prints each element of list on separate lines
Accumulator: Ex: nums = [1, 2, 3] Accum = 0 For x in accum: Accum = accum + x Print accum → returns 6, adds values in list starting at 0
Data files: Open & read – open(filename, ‘r’) Open & write – open(filename, ‘w’) Close file – filevariable.close() Read line – filevar.readline() Returns list of strings – filevar.readlines()
Dictionaries: Keys – returns view of keys in dictionary Values – return values in dictionary associated w/ keys Items – return key-value pairs from dictionary x.get – returns value associated with key
Accumulate texts: Finding amount of occurrences in dictionary Ex: f = open (‘document.text’, ‘r’) Txt = f.read() T_count = 0 For x in txt: If x == ‘any letter’: Anyletter_count = anyletter_count + 1 Print “any letter:” + str(anyletter_count) + “occurences”
Function: Def name(paramters): Return statements used in functions to return value You’re connected to directory, ~/Documents/Courses/106/F14/E xams. Write unix command that displays contents of ~/Documents/Courses/106 Cd ~/Documents/Courses/106 or ls ~/Documents/Courses/106/
Tuples: Represent records Name = (“List”, “of”, “many”, “records”, “145”)
While: Evaluates whether condition is true/false, if false, exits while statement, if true, executes each statement, then goes back to step 1

Unix: Path to Desktop – Users/Name-of-Comp/Desktop Cd – change direction- cd /Users/Name/Desktop Connect to home directory – cd ~ Connect to folder – cd Documents/Name-of-folder Is – lists all files in a directory→ /Documents/Folder ls Cat – shows contents of a file/lets you concatenate them together Ex: cat sample.txt To concatenate: cat sample1.txt sample2.txt Less – lets you move between lines in a file Ex: less sample.txt Q = quit Cd .. - allows you to go back a layer Grep “program” a_file – lists all files that contain “program” (pipe) – puts output from a file as the input on another list1>list2 - puts list 1 in list2 python file.py – gets a python file
Dictionaries ex: D = {‘one’:1, ‘two’:2, ‘three’:3} Print d.keys() Prints [‘one’, ‘two’, ‘three’], same thing happens with values For x in d: Print d[x], prints values. 1 2 3 print x - prints keys
String methods: .upper – all caps .lower – all lowercase .count – returns # of occurrences .find – returns left most index where substring is found, if not there, gives -1 .index – like find but causes a runtime error if not found Write 1 line of code that accomplishes what last three lines of code do T = (20, 30, 40) X = t[0] Y = t[1] Z = t[2] X, y, z = t What value prints? Def g(x, y): Z = y+x Return y Y=10 Z=g(5,y) Print z 10 What will this print? X = -1 Y = -2 Z = -3 Def h(x, y=2, z=3): Print x, y, z H(1) 1, 2, 3 Assume following has been executed L = [{‘a’:1, ‘b’:2, ‘d’:11}, {‘a’:4, ‘b’:5, ‘e’:11}, {‘a’:7, ‘b’:8, ‘f’:11}] Write code to print each value associated with key ‘b’ in each of dictionaries in L, should print 2 5 8 for d in L: print d[‘b’]

Function that is_prefix, takes 2 strings – true if 1 st is prefix of second, false otherwise Def is_suffix(x, y): A = len(x) If x in y[a:]: Return True Else: Return false Print is_suffix(“He”, “Hello”) Print is_suffix(“Hi”, “Hello”) Print is_sffix(“lo”, “Hello”)

Consider 2 files. First has 3 verses, 1 chorus repeated after each verse. Second has 6 verses, all different from each other. Both files have same # of characters . Which file has more info, chorus or no chorus?
File with no chorus has more info b/c more none repeated info.
Consider 2 coins, one "fair", lands on heads/tails 50/50. Other is "biased" which lands heads 75% of time. Which gives more info, fair or biased?
Fair gives more info- higher info entropy b/c 50% chance instead of 75%/25%.
